[What is a Data Engineer?](#)[Exam and Course Overview](#)

## *What is a Data Engineer?*

### Google's definition:

A Professional Data Engineer enables data-driven decision making by collecting, transforming, and visualizing data. The Data Engineer designs, builds, maintains, and troubleshoots data processing systems with a particular emphasis on the security, reliability, fault-tolerance, scalability, fidelity, and efficiency of such systems.

The Data Engineer also analyzes data to gain insight into business outcomes, builds statistical models to support decision-making, and creates machine learning models to automate and simplify key business processes.

### What does this include?

- Build data structures and databases:
  - Cloud SQL, Bigtable
- Design data processing systems:
  - Dataproc, Pub/Sub, Dataflow
- Analyze data and enable machine learning:
  - BigQuery, Tensorflow, Cloud ML Engine, ML API's
- Match business requirements with best practices
- Visualize data ("make it look pretty"):
  - Data Studio
- Make it secure and reliable

### Super-simple definition:

Collect, store, manage, transform, and present data to make it useful.

Data Lifecycle

Batch and Streaming Data

Cloud Storage as Staging Ground

Database Types

Monitoring Unmanaged Databases

## *Data Lifecycle*

[Next](#)

- Think of data as a tangible object to be collected, stored, and processed
- Lifecycle from initial collection to final visualization
- Needs to be familiar with the lifecycle steps, what GCP services are associated with each step, and how they connect together
- Data Lifecycle steps:
  - Ingest - Pull in the raw data:
    - Streaming/real-time data from devices
    - On-premises batch data
    - Application logs
    - Mobile-app user events and analytics
  - Store - data needs to be stored in a format and location that is both reliable and accessible
  - Process and analyze - Where the magic happens. Transform data from raw format to actionable information
  - Explore and visualize - "Make it look pretty"
    - The final stage is to convert the results of the analysis into a format that is easy to draw insights from and to share with colleagues and peers

Choosing a Managed Database

Cloud SQL Basics

Importing Data

SQL Query Best Practices

## Choosing a Managed Database

Next

### Big picture perspective:

- At minimum, know which managed database is the best solution for any given use case:
  - Relational, non-relational?
  - Transactional, analytics?
  - Scalability?
  - Lift and shift?

Relational

Non-relational

Object -  
Unstructured

Data

Cloud Datastore Overview

Data Organization

Queries and Indexing

Data Consistency

## Cloud Datastore Overview

[Next](#)

### What is Cloud Datastore?

- No Ops:
  - No provisioning of instances, compute, storage, etc.
  - Compute layer is abstracted away
- Highly scalable:
  - Multi-region access available
  - Sharding/replication handled automatically
- NoSQL/non-relational database:
  - Flexible structure/relationship between objects

### Use Datastore for:

- Applications that need highly available structured data, at scale
- Product catalogs - real-time inventory
- User profiles - mobile apps
- Game save states
- ACID transactions - e.g., transferring funds between accounts

### Do not use Datastore for:

- Analytics (full SQL semantics):
  - Use BigQuery/Cloud Spanner
- Extreme scale (10M+ read/writes per second):
  - Use Bigtable
- Don't need ACID transactions/data not highly structured:
  - Use Bigtable
- Lift and shift (existing MySQL):
  - Use Cloud SQL
- Near zero latency (sub-10ms):
  - Use in-memory database (Redis)

Cloud Datastore

Cloud Bigtable Overview

Instance Configuration

Data Organization

Schema Design

**Cloud Bigtable**

## *Cloud Bigtable Overview*

[Next](#)

### What is Cloud Bigtable?

- High performance, massively scalable NoSQL database
- Ideal for large analytical workloads

### History of Bigtable

- Considered one of the originators for a NoSQL industry
- Developed by Google in 2004
  - Existing database solutions were too slow
  - Needed real-time access to petabytes of data
- Powers Gmail, YouTube, Google Maps, and others

### What is it used for?

- High throughput analytics
- Huge datasets

### Use Cases

- Financial data – stock prices
- IoT data
- Marketing data – purchase histories

### Access Control

- Project wide or instance level
- Read/Write/Manage

[Return to Table of Contents](#)

## Choose a Lesson

Cloud Spanner Overview

Data Organization and Schema

## Cloud Spanner Overview

[Next](#)

### What is Cloud Spanner?

- Fully managed, highly scalable/available, relational database
- Similar architecture to Bigtable
- "NewSQL"

### What is it used for?

- Mission critical, relational databases that need strong transactional consistency (ACID compliance)
- Wide scale availability
- Higher workloads than Cloud SQL can support
- Standard SQL format (ANSI 2011)

### Horizontal vs. vertical scaling

- Vertical = more compute on single instance (CPU/RAM)
- Horizontal = more instances (nodes) sharing the load

### Compared to Cloud SQL

- Cloud SQL = Cloud incarnation of *on-premises* MySQL database
- Spanner = designed from the ground up for the cloud
- Spanner is not a 'drop in' replacement for MySQL
  - Not MySQL/PostgreSQL compatible
  - Work required to migrate
  - However, when making transition, don't need to choose between consistency and scalability

Streaming Data Challenges

Cloud Pub/Sub Overview

Pub/Sub Hands On

Connecting Kafka to GCP

Monitoring Subscriber Health

## Streaming Data Challenges

### What is Streaming Data?

- "Unbounded" data
- Infinite, never completes, always flowing

[Next](#)

### Examples

Traffic Sensors

Credit Card Transactions

Mobile Gaming

### Fast action is often necessary

- Quickly collect data, gain insights, and take action
- Sending to storage can add latency
- Use cases:
  - Credit card fraud detection
  - Predicting highway traffic

[Return to Table of Contents](#)

## Choose a Lesson

[Data Processing Challenges](#)[Cloud Dataflow Overview](#)[Key Concepts](#)[Template Hands On](#)[Streaming Ingest Pipeline Hands On](#)[Additional Best Practices](#)

## *Data Processing Challenges*

### What is Data Processing?

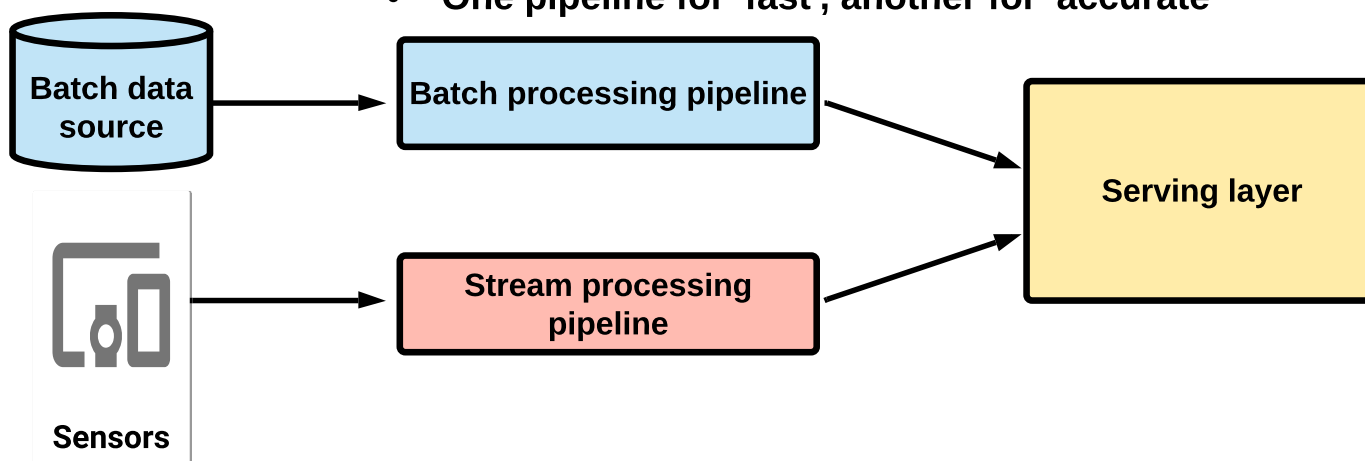

[Next](#)

- Read Data (Input)
- Transform it to be relevant - Extract, Transform, and Load (ETL)
- Create output

### Challenge: Streaming and Batch data pipelines:

- Until recently, separate pipelines are required for each
- Difficult to compare recent and historical data
- One pipeline for 'fast', another for 'accurate'

### Why both?

- Credit card monitoring
- Compare streaming transactions to historical batch data to detect fraud

## Dataproc Overview

### What is Cloud Dataproc?

[Next](#)

### Hadoop ecosystem:

- Hadoop, Spark, Pig, Hive
- Lift and shift to GCP

### Dataproc facts:

- On-demand, managed Hadoop and Spark clusters
- Managed, but not no-ops:
  - Must configure cluster, not auto-scaling
  - Greatly reduces administrative overhead
- Integrates with other Google Cloud services:
  - Separate data from the cluster - save costs
- Familiar Hadoop/Spark ecosystem environment:
  - Easy to move existing projects
- Based on Apache Bigtop distribution:
  - Hadoop, Spark, Hive, Pig
- HDFS available (but maybe not optimal)
- Other ecosystem tools can be installed as well via initialization actions

## BigQuery Overview

[Next](#)

### What is BigQuery?

- Fully Managed Data warehousing
  - Near-real time analysis of petabyte scale databases
- Serverless (no-ops)
- Auto-scaling to petabyte range
- Both storage and analysis
- Accepts batch and streaming loads
- Locations = multi-regional (US, EU), Regional (asia-northeast1)
- Replicated, durable
- Interact primarily with standard SQL (also Legacy SQL)

## *Pre-trained ML API's*

[Next](#)

### Choose a Lesson

Pre-trained ML API's

Vision API demo

**AI Platform**  
(Formerly  
Cloud ML  
Engine)

- Train, deploy, and manage custom ML models on managed infrastructure resources.
- You create the model, then Google provides managed infrastructure for testing it.

**Pre-trained  
ML models**

- Pre-trained models
- Common use cases (not customizable)
- Simply 'plug' into your application
- "Make Google do it"

[Return to Table of Contents](#)

## Choose a Lesson

[Datalab Overview](#)

## *Datalab Overview*

[Next](#)

### What is it?

- Interactive tool for exploring and visualizing data:
  - Notebook format
  - Great for data engineering, machine learning
- Built on Jupyter (formerly iPython):
  - Open source - Jupyter ecosystem
  - Create documents with live code and visualizations
- Visual analysis of data in BigQuery, ML Engine, Compute Engine, Cloud Storage, and Stackdriver
- Supports Python, SQL, and JavaScript
- Runs on GCE instance, dedicated VPC and Cloud Source Repository
- Cost: free - only pay for GCE resources Datalab runs on and other Google Cloud services you interact with

SQL

[Return to Table of Contents](#)

## Choose a Lesson

[What is Dataprep?](#)

## *What is Dataprep?*

[Next](#)

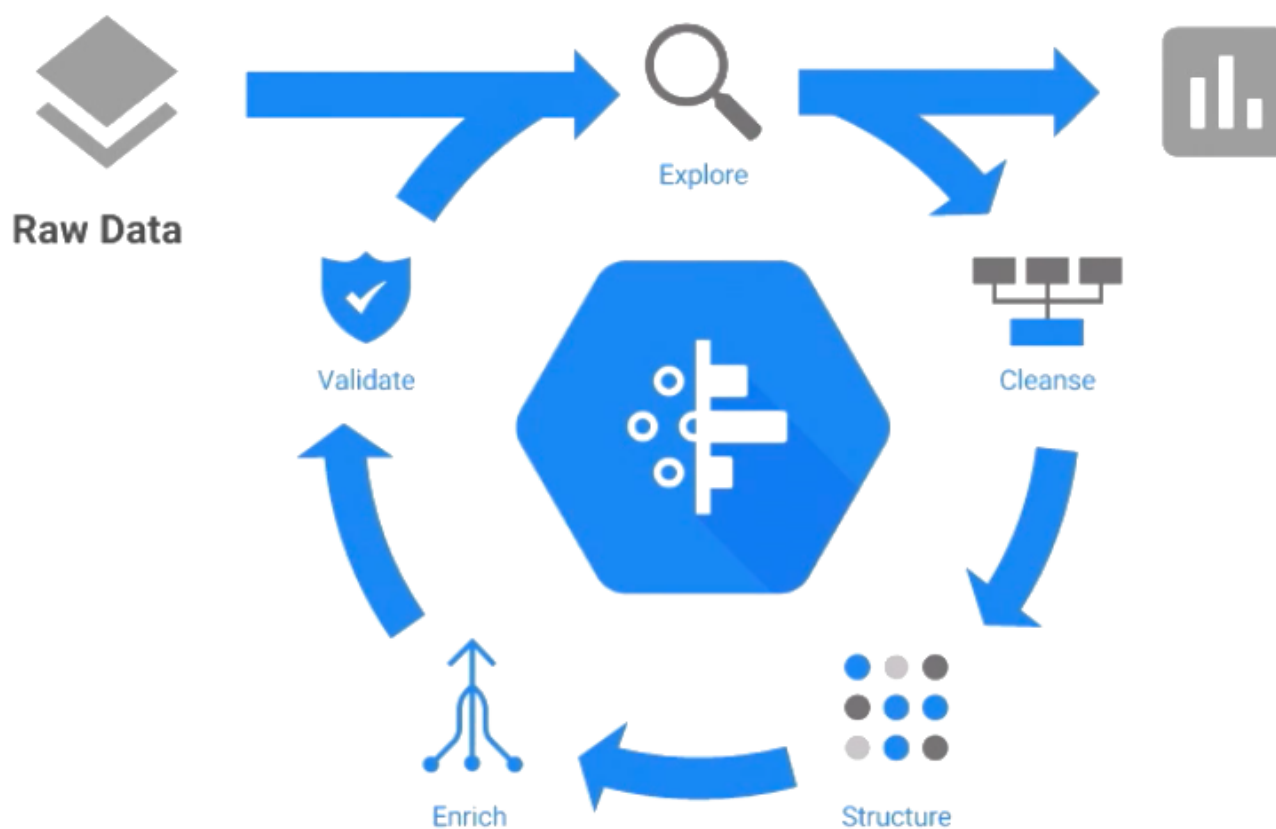

### What is it?

- Intelligent data preparation
- Partnered with Trifacta for data cleaning/processing service
- Fully managed, serverless, and web-based
- User-friendly interface:
  - Clean data by clicking on it
- Supported file types:
  - Input - CSV, JSON (including nested), Plain text, Excel, LOG, TSV, and Avro
  - Output - CSV, JSON, Avro, BigQuery table:
    - CSV/JSON can be compressed or uncompressed

### Why is this important?

- Data Engineering requires high quality, cleaned, and prepared data
- 80% - time spent in data preparation
- 76% - view data preparation as the least enjoyable part of work
- Dataprep democratizes the data preparation process

[Return to Table of Contents](#)

## Choose a Lesson

[Data Studio Introduction](#)

## *Data Studio Introduction*

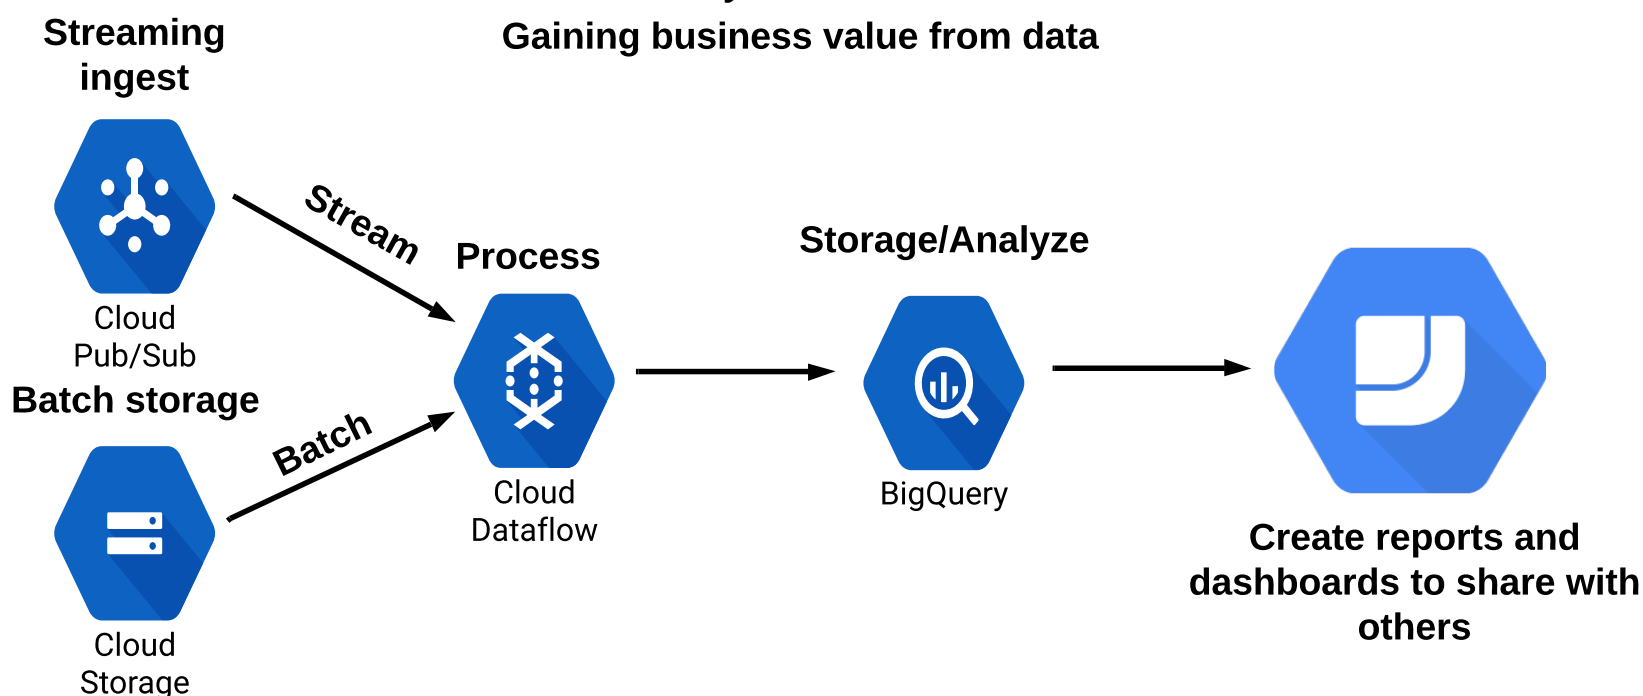

[Next](#)

### What is Data Studio?

- Easy to use data visualization and dashboards:
  - Drag and drop report builder
- Part of G Suite, not Google Cloud:
  - Uses G Suite access/sharing permissions, not Google Cloud (no IAM)
  - Google account permissions in GCP will determine data source access
  - Files saved in Google Drive
- Connect to many Google, Google Cloud, and other services:
  - BigQuery, Cloud SQL, GCS, Spanner
  - YouTube Analytics, Sheets, AdWords, local upload
  - Many third party integrations
- Price - *Free*:
  - BigQuery access run normal query costs

### Data Lifecycle - Visualization Gaining business value from data

[Return to Table of Contents](#)

## Choose a Lesson

[Cloud Composer Overview](#)

[Hands On - Cloud Composer](#)

## Cloud Composer Overview

[Next](#)

### What is Cloud Composer?

- Fully managed **Apache Airflow** implementation:
  - Infrastructure/OS handled for you

### What is Apache Airflow?

- Programatically create, schedule, and monitor data workflows

### Why is this important?

- Automation and monitoring
- Big data pipelines are often a multi-step, complex process:
  - Create resources in multiple services
  - Process and move data from one service to another
  - Remove resources when they complete a task
- Collaborate workflow process with other team members

### How Airflow/Composer helps

- Automates the above steps, including scheduling
- Built on open source, using Python as common language
- Easy to work with, and share workflow with others
- Works with non-GCP providers (on-premises, other clouds)
